

Technical Data Sheet

COBB 100

Product Description

COBB 100 Ground Corn Cobbs is formulated to provide operators with a high-performance LCM designed for use in highly fractured and vugular formations. The wide particle size range of **COBB 100** minimizes the possibility of the resulting hard plug being removed during drilling operations, eliminating repeated remedial treatments in the same zone.

Applications: to remediate partial to massive losses in the open hole and/or sealing perforations in cased hole.

Treatments: in a lost circulation pill, in concentrations of 5 – 25 ppb of each. These pills may be used in sweep fashion or spotted downhole for a period of 2 – 4 hours to affect a lasting seal. Applying a soft squeeze with a pill in place will further advance sealing effectiveness

KEY BENEFITS

- Sealing high permeability sands where substantial seepage losses occur
- Can be pumped through down hole tools up to 100 ppb.
- Stopping major loss of mud and workover fluids in fractured formations.

Key Properties

Shelf life	24 months
Color	Light Brown
Physical Form	Powder
Sg	1.84
Packaging	25 lb Sacks
